Building the Orbital Cloud for the AI Civilization

BC Space integrates DeStarAI (orbital AI data centers) and DeStarlink (decentralized starlink network) into a unified space infrastructure, where data can flow, compute, and verify beyond Earth.

Problem: Traditional Infra?

1 Earth's Compute Bottleneck

- AI is pushing data centers to their limits; power demand may triple by 2030
- Cooling consumes ~40% of total power
- Grid capacity limits and regulations hinder expansion

DeStarAI uses orbit for solar-powered, naturally cooled AI cloud computing

2 Trust & Sovereignty Gap in Connectivity

- Geopolitical and service disruption risks. For example, Starlink services have been suspended in regions like Ukraine and Russia due to political conflicts.
- Over 2.6 billion people still lack internet access

DeStarlink offers a neutral, decentralized, globally-owned communication network

Building the Decentralized Orbital AI Cloud

One Integrated Architecture

BC Space unifies connectivity and computation into a single orbital infrastructure layer.

Orbital AI data center network,
powered by solar energy

Decentralized satellite
communication providing global,
censorship-resistant connectivity

An Orbital Cloud where data flows,
computes, and verifies in space

Why Space Solves What Earth Can't

- Earth-based AI data centers are energy-hungry and cooling-limited
 - Solar-powered orbital compute nodes use natural radiative cooling in vacuum, enabling sustainable large-scale AI computation.
- Energy-intensive data centers (cooling = 40% of cost)
 - Solar-powered compute nodes with natural radiative cooling
- AI workloads require global coordination and real-time inference
 - In orbit, thousands of satellites collaborate as an autonomous computing swarm, delivering distributed inference and training beyond Earth's grid limits.
- Trust & resilience concerns
 - Fully verifiable orbital infrastructure — cannot be switched off.

Product: Decentralized Orbital AI Layer

BEARCAT SPACE NVIDIA JETSON ORIN NX

The BC Genesis satellite deploys an NVIDIA AI chip as a validation payload for in-orbit AI inference experiments.

But this is only the first step — our production roadmap targets **H100/Blackwell-class and radiation-hardened GPU/FPGA/ASIC modules**, creating a true orbital AI data center.

The world's first distributed AI compute layer in orbit — connected, solar-powered, verifiable.

Product: Decentralized Orbital AI Layer

Our first satellite, carrying an onboard blockchain wallet, will perform the world's first in-orbit blockchain transaction signature, proving the foundation of decentralized space infrastructure.

Our second satellite will feature a camera and display, enabling the first-ever orbital advertising slot and expanding the constellation toward a censorship-resistant TEE Starlink network.

Each launch brings us closer to a censorship-resistant, verifiable space internet.

The Orbital AI Cloud Architecture

Where Communication Meets Computation

BC Space integrates decentralized connectivity (DeStarlink) and orbital AI computation (DeStarAI) into a unified, intelligent satellite architecture — where data moves, computes, and verifies entirely in orbit.

The Orbital AI Cloud Architecture

BC Space orbital infrastructure stack, where data is transmitted via DeStarlink, processed by DeStarAI, and verified through the same orbital mesh.

Data Flow

1 Uplink

Ground sensors send encrypted data to nearest DeStarlink satellite

2 Routing

DeStarlink relays packets across optical mesh (<10 ms latency)

3 Compute

DeStarAI executes real-time inference using HFO/Blackwell AI chips

5 Downlink

Processed data transmitted back to Earth

4 Verification

Results verified/signed via blockchain Orah Node

From Earth to Orbit

— The Closed-Loop of AI Computation

BC Space connects ground AI systems and orbital AI nodes into a single self-learning compute loop — enabling “Earth-to-Orbit” inference and “Orbit-to-Orbit” learning.

Earth-to-Orbit Inference

Ground AI models offload intensive tasks — like simulation or modeling — to DeStarAI orbital nodes.

Data is transmitted via DeStarlink and processed in space using solar-powered GPUs.

Orbit-to-Orbit Learning

DeStarAI nodes perform in-orbit fine-tuning and self-optimization.

Updated models are shared across the constellation via optical mesh for continuous, coordinated learning.

Verified Return

Results and models are authenticated through the Blockchain Orbit Node before being sent back to Earth — closing a trusted intelligence loop.

Together, Earth and Orbit form a self-evolving intelligence network — where every computation strengthens both AI and infrastructure.

Market TAM: The Orbital Cloud Economy

Total Addressable Market (2030E)

Segment	Examples	2030E Market Size	BC Addressable Share
AI compute infrastructure	Data centers, cloud	t\$1.3T+	2–3% off-grid / orbital compute market
Global satellite Internet	Starlink, Amazon Kuiper, China GW	\$400B+	5–8% niche B2B & high-security market
Space infrastructure & DePIN	Decentralized applications	\$300B+	3–5% decentralized infrastructure demand

\$2T+ Total Addressable Market

Comparable Business Models

Starlink

Monetizes bandwidth

AWS

Monetizes computation

BC Space

Monetizes bandwidth + compute synergy

Business Model: One Network, Two Monetization Layers

Layer	Product	Revenue Model	Customers
Communication Layer (DeStarlink)	Secure satellite communication, IoT & defense-grade data relay	Bandwidth leasing, enterprise subscription	Governments, logistics, telecoms, DePIN projects
Computation Layer (DeStarAI)	In-orbit AI compute, model inference, secure storage	Compute rental (AI cloud model), API pricing per inference	AI labs, autonomous systems, defense, crypto infra
Unified Services	Hybrid communication + compute packages	B2G / B2B orbital infrastructure contracts	National agencies, global enterprises, Web3 foundations

We sell infrastructure, not connectivity — the combination of Starlink's network and NVIDIA's compute forms a service layer comparable to AWS + SpaceX in orbit.

Competitive Landscape: Our Unique Position

BC Space integrates decentralized communication with orbital AI compute — a combination no other player offers.

Segment	Key Players	Limitations	BC Space Advantage
Communication	Starlink, State Constellations	Centralized control, geo-limited, not neutral	Decentralized, neutral & censorship-resistant network with in-orbit signing
Orbital Compute	Starcloud, AWS Kuiper	Early planning stage, unproven AI capabilities	Full-stack AI solution with hardware prototype and clear path to H100/Blackwell chips

BC Space Edge

1/3-1/5 manufacturing cost

via China's supply chain

6-9 month build-to-orbit cycle

vs 18-24 months industry avg

Integrated closed loop system

Communication, compute and energy — no competitor offers this

We are the first mover with a working prototype and a credible roadmap to deliver a unified orbital cloud.

Roadmap: From Constellation to Cloud

Connectivity comes first, computation scales next — until both merge into an autonomous orbital cloud, governed by AI optimization and blockchain verification.

Partners & Investors

Strategic Partners

- Singapore Academy of Engineering & NTU
- NVIDIA
- Galaxy Space
- Galactic Energy
- SparkX Satellite
- AscendX Aerospace

Investors

- Matrix Partners
- K2 Venture Capital
- Nasdaq Listing Companies (AI Data Centre)
- Seed Round Valuation: \$50M USD

Backed by the global leaders in AI and aerospace — bridging space-grade engineering with AI acceleration.

Team

The team combines aerospace, AI, and financial expertise — spanning US, Europe, Singapore, Hong Kong, and the global frontier of orbital engineering.
